

BOTOX INJECTIONS

Facial Injection is a cosmetic injection that blocks the nerve signals that cause muscles to contract. This effect relaxes and smooths the look of lines and wrinkles caused by repetitive movements on the face—most commonly, between the brows, crows-feet around the eyes, and horizontal forehead creases. Various approved products are also used cosmetically to balance facial asymmetry and relax tight neck bands, as well as medically to reduce perspiration and to treat migraine headaches and muscle spasticity.

When to Consider Facial Injections

Deep lines between your eyes make you look tired, angry, sad, or upset. Your facial expressions cause wrinkles in and around your eyes and forehead. There is asymmetry in your eyebrows or face that can be corrected by relaxing a muscle. You suffer from migraine headaches and botulinum toxin may provide relief from this condition.

FILLERS

Also known as dermal fillers and soft tissue fillers Fillers are a type of minimally invasive aesthetic medicine used to add volume, alter the contours of the face, and fill in wrinkles. Common areas to inject fillers are in the face, neck, and hands, resulting in a fuller, smoother and more youthful appearance. Dermal fillers are among the most popular aesthetic procedures because they carry immediate results, very few risks and little recovery time.

When to Consider Fillers

- If you have deep lines around the eyes, brow or mouth.
- If you would like to change the contours of your jaw or lips.
- If you are interested in a minimally invasive procedure.
